                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  900
A restriction fragment of the insert of M.gallisepticum genomic clone pUM -67 containing an open reading frame was sequenced (AAQ77857). The ORF encodes an antigenic polypeptide. A recombinant avipox virus comprising the coding sequence can be used as a live vaccine to protect against infection by Mycoplasma gallisepticum. (Updated on 25-MAR-2003 to correct PN field.)

```
The plasmid pUTIM-1P contains a sequence (the TIM-1 gene) coding for the plasmid pUTIM-1P contains a sequence (the TIM-1 gene) coding for the promoter. A 1300 by restriction fragment containing the promoter-ORF sequence was excised and was used in the construction of plasmid pNZ7929-RZ. This in turn was involved in the construction of a recombinant avipox virus vector comprising the TIM-1 gene, DNA encoding the signal membrane anchor peptide from Newcastle Disease Virus haemagglutinin neuraminidase and FVM sequences. The recombinant avipox virus is useful as a live vaccine to protect against infection by Mycoplasma gallisepticum.

DNA molecule derived from a prokaryotic cell, useful for producing a vaccine for treating viral infections comprises at least one modified DNA regions encoding NXB so that no N-glycosylation occurs during expression.

Claim 9; Page 30; 70pp; English

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = asparagine, X = any amino acid other than proline, and B = series or threonine) has been modified on their no N-glycosylation occurs during the expression in a eukaryotic cell. Also described in a fused DNA collecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it of N-terminal end of the modified DNA molecule as described above; integrated or with the DNA molecule or the fused DNA molecule by using the recombinant virus of producing a modified or fusion protein by using the recombinant virus of escribed above, to express a protein encoded by the modified DNA collecule or the fused DNA molecule in a eukaryotic cell; and (4) a collecule or the fused DNA molecule is useful for producing a vaccine for treating viral infections. The DNA molecule has virucide a vaccine for treating viral infections. The present sequence is used in X Sequence 1152 BP; 437 A; 190 C; 188 G; 337 T; 0 U; 0 Other;

This sequence encodes the chimeric protein 40 K-S which comprises a fragment of the Marek's disease virus outer membrane protein gB fused to an artigenic protein from Mycoplasma gallisepticum. The chimeric protein can be used in recombinant live vaccines for prevention of infection by Mycoplasma gallisepticum, especially as the outer membrane protein shows antigenicity in poultry
                                                                                                                                                                                                                                                                                                                                            AAGACTATGCCAAGATTGAAGCTAGTTTATCATCTGCTTATAGTGAAGCTGAAACAGTTA

The chimeric protein can be used in recombinant live vaccines for prevention of infection by Mycoplasma gallisepticum, especially as the outer membrane protein shows antigenicity in poultry

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of a fragment of the Mycoplasma gallisepticum genome which codes for a 261 amino acid protein. This sequence and the sequence of AATO4075 (encoding a 661 amino acid protein) can be used to detect M:gallisepticum using probes based on nucleotides 1125-1648 and primers based on nucleotides 449-466, the complement of AATO4075, and a probe based on nucleotides 718-41 of this sequence. The method using these sequences is faster i.e. is able to detect non wild have a faster i.e. is able to detect on a graphicum, which causes avian chronic respiratory diseases, within one day, from avian secretions, washings from the lung, respiratory tract, nasal cavity, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

15-JAN-2003

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = asparagine, X = any amino acid other than proline, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA molecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as a fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3) producing a modified or fusion protein by using the recombinant virus integrated with the fused DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule has virucide a vaccine for treating viral infections. The DNA molecule is useful for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention 120 300 DNA molecule derived from a prokaryotic cell, useful for producing a vaccine for treating viral infections comprises at least one modified DNA regions encoding NXB so that no N-glycosylation occurs during expression. When inserted into a recombinant vector used to transform a host the antigen protein produced can be used as a vaccine to prevent and diagnose MG infection.                              This base sequence of M1 encodes the MG1 polypeptide which elicits an antigen-antibody reaction with anti-MG poultry sera. When inserted into a recombinant vector used to transform a host the antigen protein produced can be used as a vaccine to prevent and diagnose MG infection. The DNA can be inserted into an expression vector for the prodn. of polypeptide which elicits an antigen-antibody reaction with anti-mycoplasma gallisepticum poultry sera. It may also be ligated to other DNA to produce fusion proceins with an N-terminal bacterial enzyme sequence. See also AAQ04687 and AAQ05649-53. (Updated on 10-MAR-2003 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     340 GCGCGAATGGAGTTAACAGATCTAATCAATGCTAAAGCGATGACATTAGCTTCACTACAA
